

# Vrelo Miljacke

Vrelo Miljacke

43.7897478, 18.5722926

Vrelo Miljacke springs southeast of the center of Pale on the northern slope of Ravna Planina and at an altitude of about 1,010 m in the form of stronger karst springs of the gravitational type. Mountain streams murmur in their cascades and in a magical forest ambience descend down the riverbed and ravines until they merge into a single river that flows into the Pale plain. The beautiful landscape and clean air are exceptional, so it is not surprising that this place has long been attractive for vacation. When heavy rains fall or when the snow from Jahorina begins to melt, these river streams gain strength and intensity.
